Re: **Servicing Feasibility Study**
Proposed Stacked Townhouse Development
24546 Adelaide Road, Strathroy, Ontario

1. INTRODUCTION

This Servicing Feasibility Study (Study) has been prepared by Strik, Baldinelli, Moniz Ltd. (SBM) for 1000585742 Ontario Inc. to address the servicing feasibility for the proposed 0.43 ha stacked townhouse development located at 24546 Adelaide Road, Strathroy.

The site abuts residential lands to the north, a low-density residential dwelling and agriculture lands to the east, Adelaide Road Right-Of-Way (ROW) to the south, and commercial lands to the west. It is our understanding that the proposed development is to include two (2) three and a half storey townhouse buildings (32 units total) with associated parking areas and common amenity spaces. See the proposed Concept Plan by Siv-ik Planning & Design Inc. dated January 16, 2024, enclosed with this Study.

This Study is to determine the adequacy of the existing Municipality of Strathroy-Caradoc services in support of Official Plan Amendment (OPA) and Zoning By-Law Amendment (ZBA) application for the proposed development.

Design requirements have been based on the Municipality of Strathroy-Caradoc Servicing Standards (MSCSS), dated October 2021, the Ministry of the Environment, Conservation and Parks (MECP) design guidelines, and the current edition of the Ontario Building Code (OBC).

2. WATER SERVICING

According to the Municipality's record drawing "Adelaide Road from 0+680.183N to 1+050.183N", prepared by Development Engineering dated April 13, 1999, there is an existing 400 mm PVC watermain in the Adelaide Road ROW. There is one existing 25 mm water service to the proposed site shown on the record drawing, which will not be adequate to service the proposed 32 units therefore it will need to be decommissioned and replaced with a larger service to be designed as part of the Site Plan Approval process.

2.1 Domestic Water Supply

The maximum hour domestic demand, as per the MSCSS for a population of 77 people (32 units at 2.4 people per unit per Section 4.3.2 of the MSCSS) is 1.74 L/s. See the attached domestic water demand calculations.

2.2 Water Supply for Fire Protection

Section 4.3.2 of the MSCSS requires the minimal residual pressure during Maximum Day plus Fire scenario to be not less than 140 kPa (20 psi) at any location in the water distribution system.

Since the proposed buildings are Part 9 per the OBC, a sprinkler system is not required for the proposed buildings and therefore fire-fighting demand is determined as per OBC Vol-2, Section A-3.2.5.7. The calculations, attached to this Study, were based on the most conservative building (20-unit stacked townhouse) and result in a required fire flow rate of 3600 L/min which was combined with the maximum day domestic demand of 46.8 L/min to obtain the required supply fire flow + maximum day demand of 3647 L/min.

Fire hydrant flow test results were provided by the Municipality and are attached to this Study. The nearest test was at the municipal hydrant located at the corner of Caradoc St. and Carroll St. The flow test results show that the static pressure of the water distribution system in the area is 379.21 kPa (55 psi) and the residual pressure is 344.74 kPa (50 psi) at a test flow rate of 6598 L/min (1743 USGPM).

Upon review of the hydrant flow test results and using linear interpolation of the residual pressure readings at the provided flow rates from the hydrant at the corner of Caradoc Street and Carroll Street, there is sufficient pressure within the system. At the required maximum day plus fire-flow demand rate of 3647 L/min, the residual pressure in the system would be approximately 52.24 psi (360.16 kPa) which exceeds the minimum required pressure of 20 psi (140 kPa) in fire-flow scenarios. Please refer to the calculations attached to this Study.

According to the Municipality's record drawing "Adelaide Road from 0+680.183N to 1+050.183N", prepared by Development Engineering dated April 13, 1999, there is an existing hydrant fronting the property available to provide fire flows to the proposed development.

2.3 Water Supply Conclusions

Since there is sufficient water supply for the fire-flow plus maximum day demand of 60.8 L/s (3647 L/min) with residual pressure greater than 40 psi, as demonstrated in Section 2.2, and the peak hour domestic demand of 1.74 L/s is less than the fire-flow plus maximum day demand, it can be concluded that adequate water supply for the proposed development is available from the municipal system.

3. SANITARY SERVICING

As per the Municipality's record drawing "Plan and Profile of Adelaide Road from Sta. 2+590 to Sta. 2+740", prepared by B. M. Ross and Associates Limited dated July 30, 2008, the site is tributary to the 250 mm sanitary sewer in the Adelaide Road ROW with a sanitary PDC (size unknown) currently servicing the site. The existing sanitary PDC will need to be investigated to determine size, invert elevations, and slope so that it can be evaluated to determine suitability to service the proposed development. If found to be inadequate, it will be required to be capped at the property line and a new sanitary PDC shall be installed.

The proposed flows from the subject property are shown on the Sanitary Sewer Design Sheet appended to this Study. Using a flow of 300 L/capita/day and a population of 77 people (32 units at 2.4 people per unit) as per the MSCSS results in an anticipated peak sanitary flow of 1.26 L/s. When combined with infiltration, this results in a total peak flow of 1.29 L/s. A private drain connection of a minimum diameter of 200 mm with a minimum slope of 1% is required which has sufficient capacity of 32.82 L/s to convey the proposed flows.

4. STORM SERVICING AND STORMWATER MANAGEMENT

As per the email received from Maria F. Camacho (Municipality of Strathroy-Caradoc) on November 20, 2023, there is no existing storm sewer in the Adelaide Road ROW.

As shown on the Runoff Coefficient Calculations attached, the post development runoff coefficient is 0.62 for the proposed development which is greater than the pre-development runoff coefficient of 0.23. The Phase I&II Environmental Site Assessment (Project No.: LON-00016790-EN) prepared by EXP Services Inc., dated February 1, 2019 (provided separately) concludes that the site's subsurface generally consists of sand and gravel fill and/or sand fill, overlying native sand with a groundwater depth ranging between 2.46m and 2.73m as measured in January 2019. Additional measurements may be required to determine seasonal high groundwater elevations. Per the MECP Stormwater Management Planning and Design Manual, the water table is required to be a minimum of 1m below the bottom of the infiltration trench, therefore, the site

appears to be conducive to at-source infiltration. Therefore, SWM quantity controls (i.e. Low Impact Development (LID) controls) will be designed to control post-development flows for the 2-year through 100-year storm events to the pre-development levels. The 250-year storm event will be safely conveyed overland generally matching the existing conditions of the site.

5. SUMMARY

Based on the above, the existing municipal infrastructure and proposed site services have sufficient capacity to accommodate the proposed townhouse development of the 0.43 ha subject site located at 24546 Adelaide Road, Strathroy.

6. LIMITATIONS

This Study was prepared by SBM for 1000585742 Ontario Inc. (owner), the Municipality of Strathroy-Caradoc, and the County of Middlesex. Use of this Study by any third party, or any reliance upon its findings, is solely the responsibility of that party. SBM accepts no responsibility for damages, if any, suffered by a third party as a result of decisions made or actions undertaken as a result of this Study. Third party use of this Study, without the express written consent of the Consultant, denies any claims, whether in contract, tort, and/or any other cause of action in law, against the Consultant.

All findings and conclusions presented in this Study are based on site conditions as they appeared in the information presented to SBM and related to in this document. This Study is not intended to be exhaustive in scope, or to imply a risk-free development. It should be recognized that the passage of time may alter the opinions, conclusions, and recommendations provided herein, as well as any changes in the layout of the development.

The design was limited to the documents referenced herein and SBM accepts no responsibility for the accuracy of the information provided by others. All designs and recommendations presented in this Study are based on the information available at the time of the review.

7. CLOSURE

We trust this Study meets your satisfaction. Should you have any questions or require further information, please do not hesitate to contact us.

Respectfully submitted,

Strik, Baldinelli, Moniz Ltd.
