MUNICIPALITY OF STRATHROY-CARADOC ROAD MANAGEMENT STUDY - 2024

1.0 PURPOSE

Roads, like anything else, suffer from the effects of “wear and tear”. Unless the road system is adequately maintained by appropriate rehabilitation strategies at the proper time, it will quickly deteriorate to the point where major expenditures will be required to bring it back to acceptable standards. This neglect is unwise and a very expensive management strategy which will result in deteriorating road conditions and higher improvement costs.

This Road Management Study provides an inventory of the existing roads and a means for examining the physical and financial needs of the road system in order to plan for the next five and ten year programs of action within the operating and capital budget of the Municipality.

The condition assessment process used for this study was developed by the Ministry of Transportation of Ontario. The condition scores are determined by comparing the existing roads and streets to the pre-determined standards defined in the guidelines. Additional parameters are also assessed to help prioritize the needs. The financial needs of maintaining the road system and addressing deficient sections were assessed and compared to the funds typically supplied by the municipality to maintain the road system.

This Road Management Study has been prepared by B. M. Ross and Associates Limited (BMROSS) for the Municipality of Strathroy-Caradoc in general accordance with the Ministry of Transportation’s Inventory Manual. The road survey used to assess the roads was undertaken in the summer of 2024 and as requested, only the hard surface roads were reviewed; gravel roads were not part of this study.

2.0 SCOPE OF THE STUDY

This study is to help the Municipality prioritize the road improvement schedule in a cost-effective way and help predict future costs, assuming that the Municipality generally wants to maintain the current level of service of the existing roads.

Recommendations and probable costs for work to be completed over the next 5 year time period and anticipated road work for the 6 to 10 year time period are provided. The work in the 6 to 10 year time period is intended as a guide for future long term budgeting purposes; with the understanding that deterioration rates and repair needs are less accurate when making longer term projections. An updated needs study should be completed in five years to re-assess the condition of the roads and the priorities for the subsequent five year period.

In general, the assessment process is divided into the following major components:

1. Prepare an inventory of the road system using information supplied by the Municipality, information from our previous assessment reports, and road map network data.
2. Review the road sections to assess the condition of the roads, note maintenance problems, preventative maintenance options, and collect historical information about repairs to road sections.
3. Review of the traffic counts that the Municipality provided and use that information to determine the maintenance class for each section of road.
4. Assemble and summarize the operational cost and typical capital budget information provided by the Municipality.
5. Enter and assemble the information gathered to assess the statistical condition of the roads, issues identified during our review, and develop a priority list of the needs.
6. Prepare the road assessment report in draft format, present it to municipal staff for review and comment, then revise and finalize the report as per comments.

Note: Assessment of the road sections for conformance with current Provincial standards for horizontal and vertical alignment is beyond the scope of this study. If a road section is reconstructed, conformance should be reviewed during the design stage and the road section should be modified as required. Conformance with standards of the 'Uniform Traffic Control Devices (signage) Manuals' was not within the scope of this study.

Disclaimer: This conditional assessment was completed by performing a visual assessment of each road section to evaluate the structural condition of the road cross-section and the condition of the road surface. We did not examine other aspects of the road such as, completing an assessment of roadside safety, geometrics design of the road and/or evaluating the intersections and/or traffic control devices.

3.0 ASSESSMENT AND PRIORITIZING METHODOLOGY

The methodology used in this study to assess the condition of the road sections was generally completed in accordance with the MTO's Method and Inventory Manual. The 1991 version provides an extensive list of parameters; however, it does not provide specific direction on how to evaluate risk and the level of service being provided by the asset to satisfy the typical requirements of an asset management plan. The earlier version of the manual included a methodology to calculate the theoretical year of need, which we have also referred to when creating the assessment process. An explanation of the procedures used to collect the data and combine the condition scores to prioritize the needs is outlined in this section of the report. A table summarizing the priority scoring factors is provided in Appendix C-2.

3.1 Inventory of Road Sections

The Municipality provides the road sections to be used in the study, with the sections being divided typically by block. An inventory of each of these road sections was gathered in the field and entered onto an Appraisal Sheet as shown in Figure No. 1. Copies of the data are provided to the Municipality in a separate bound document from this report. Each sheet shows two road sections from the database where the information is stored. When municipal staff provided previous construction information for a road section it was included in the road appraisal sheet as well. This information was used to help determine the proper type of road improvement.

Boundary road sections where costs are shared with the bordering municipality have been included in the total inventory length. When costs are provided for these sections, the entire expected cost is indicated with no adjustment for division between municipalities.

Traffic volume ranges were either provided based on traffic count data, or estimates where discussed with municipal staff members at the time of the field review.

3.2 Condition Assessing

During the field review characteristics of each road section were recorded and condition scores were assigned to each road section for the surface and structural condition, taking into account the integrity of the road. Also, a drainage condition score assessing the suitability of the drainage system for the granular base of the road system was assigned to each section. These scores are based on a visual review unless municipal staff provided additional information about the performance or construction history of the road section.

As outlined in the MTO manuals, the Condition Rating numbers take into consideration the surface condition and structural adequacy of the road section based on the visual inspection. The rating numbers were assigned on a scale of 1 to 10 with the lower numbers describing those roads with the most surface and structural distress. The higher the rating numbers, the better the condition of the road. As per the 1985 version of the Manual, road sections with Surface Condition Ratings of 5 or less at the time of this Road Appraisal, or within the five-year forecast; theoretically, have a theoretical need for improvement. A cost to address the identified needs are calculated for each road section expected to deteriorate down to a condition rating of 5 within the next 10 years. However, with gravel roads that have traffic volumes of less than 50 AADT, only maintenance work would generally be recommended.

Note, condition rating numbers do not consider the road width, vertical and horizontal alignment, or an assessment of the road to determine if its constructed in accordance with suitable standards for the amount of traffic it passes. With this way of rating, it is possible to have a road with condition rating of 10 but the alignment, or other components could be sub-standard. These other parameters are assessed and scored separate from the condition rating and used when prioritizing the needs. The scoring process elevates the priority to address needs on the road sections that have not been built up to appropriate standards.

Note: for paved roads of either hot mix or surface treatment, the condition ratings may be misleading because roads with a poor structural base or inadequate drainage that have been recently resurfaced, will appear to be very good. Additional information on the rating system is contained in the M.T.O. manual.

Drainage of the road base has a significant impact on the performance of the road and the amount of maintenance required. MTO added a drainage condition score to later versions of the Inventory Manual. With this study the drainage condition rating for each road section is scored as good, fair or poor. The score is relative for the drainage system that appears to be provided when compared against the optimum drainage system. No material samples were collected to assess the drainage capabilities of the granular base in the road and drainage tile along the sides of the roads were not inspected as part of this report. The score is assigned based on information supplied by municipal staff about maintenance activities for the road section and visual observations at the time of review. If there is no evidence to indicate otherwise, it will be assumed that the drainage system is suitable for the road section and a drainage rating of good is assigned.

Note, BMROSS changed the condition assessment scoring system in 2019 to better reflect the guidelines set out by the 1991 MTO manual and to try and make the scores more transparent. Previously, the condition ratings only include one condition score that took into considering both the structural base and the surface condition for each road section. Most road condition assessment scoring systems, including PCI, only look at the condition of the road surface. Our revised rating system includes a surface condition, that is similar to those other programs, but also includes a structural base score. We feel this better helps us understand the road condition and determine a more appropriate reconstruction method. For example, a gravel road surface can be restored to good condition with a few passes of the grader, but if the structural base of the gravel road is in poor condition, that road will deteriorate again rather quickly. If a paved road has a good structure but the surface is poor, we will

likely recommend rehabilitation to the asphalt surface, but it is likely not necessary to reconstruct the base of the road. Alternatively, if we know the base of the road is in poor condition those concerns should also be addressed when resurfacing the road or the reconstructed surface will deteriorate at a faster rate. These changes to the scoring method may help to explain why the 2024 condition ratings for Strathroy-Caradoc differ slightly from the last Road Needs Report in 2015.

3.3 Assumed Life Expectancy of Road Types

The life of a road is affected by many factors. These include the structural components in the road, the drainage provided for the granular base, the amount and type of traffic on the road, and weather conditions. Many of these cannot be precisely determined from a visual inspection. To predict how quickly the condition of the road will deteriorate, and when rehabilitation needs will be required, it is necessary to make an assumption about how long each different road type will last.

For High Class Bituminous pavements (hot mix), the forecast condition rating is adjusted for each year for the remaining life of the pavement prior to resurfacing. The MTO manual suggests that the life of a single lift hot mix pavement is about 10 years. Using this life cycle, the condition rating would drop by 0.5 per year. Starting with a new condition rating of 10, this would mean that the condition rating would drop to 5 and require a resurfaced lift after 10 years. Assuming the road has been constructed appropriately to current cross-section standards, the projected life expectancy of a road system is affected primarily by the amount of traffic on the road. Table 1 shows the assumed life expectancies used for the different types of roads with different traffic ranges.

Table 1: Assumed Probable Useful Life Expectancy for Roads Based on Traffic Range

Traffic Range	2-HCB	1-HCB	LCB	Gravel	Earth	Concrete
0-49	30	18	6	100	100	30
50-199	27	16	6	100	100	27
200-499	24	14	6	100	100	24
500-999	22	12	6	80	100	21
>1000	20	10	5	60	100	18

Notes

1. The above probable life (years) expectancies are considered a reasonable assumption if the road is constructed to typical standards with a structural base, i.e. asphalt and granular base, and drainage that is suitable for the application.
2. It is anticipated that there may be localized repairs and maintenance work such as crack sealing necessary to achieve the probable life expectancy.
3. Shaded cells are typically not present or recommended because they will require more frequent maintenance.
4. The actual service life of a road section is variable. The Town should review statistical information and over time adjust the life expectancies to match experience.

Low Class Bituminous road surfaces (LCB) are generally able to last about six years between re-surfacing. This would be equivalent to a condition rating drop of 0.83 each year. For this study it has been assumed that two lifts of surface treatment will be placed the first time when a low class bitumen is applied on a road, and a single lift is only applied on an existing LCB road that still has a uniform surface and appears structurally sound.

For roads with a gravel surface, it is assumed that the future condition rating will deteriorate very slowly due to continued routine, loose top maintenance. The projected life of low volume gravel roads with regular grading and biannual applications of gravel is 100 years and can be more. This would mean that

the condition rating for the next five and even ten year period would stay virtually the same for low volume gravel roads and unless a gravel road has a current condition rating of 5 it will not be identified as a road section with a need. That being said, no gravel roads were reviewed as part of this study.

3.4 Methodology to Prioritize Improvements

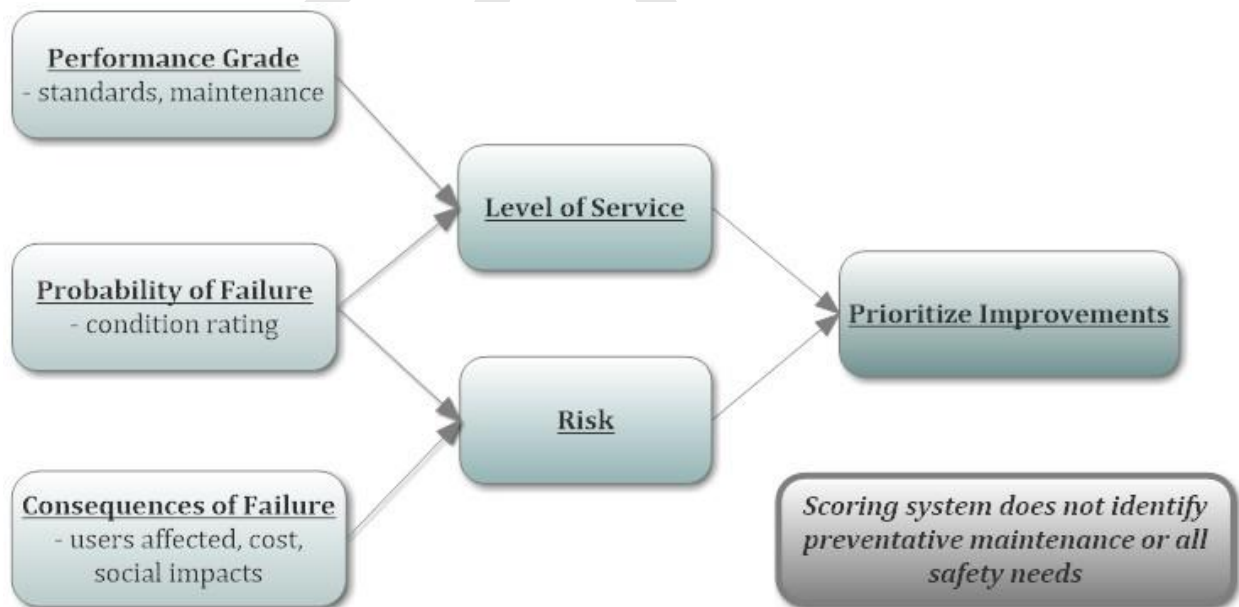

When developing a Road Maintenance Program or Asset Management Plan, we believe there are three key factors that should be taken into consideration: the probability of failure, the consequence of failure and the performance grade. While these factors can include many components, the **probability of failure** factor is generally represented by the condition rating or age of an asset.

The **consequence of failure** is a score based on the number of users affected if the asset fails or other social impacts and the cost of the asset. The **performance grade** should incorporate the relative maintenance requirements of the asset and a comparison of how the asset was built versus the appropriate design standard for that particular asset. In a simplified way these components are used in this study as illustrated in Figure 2 to develop a theoretical priority score for the improvements.

For example, if there are 10 road sections recommended for improvements in a year but the Municipality can only afford to improve 5 sections, the priority score can be used to help determine which road sections should be improved first to provide the highest level of service for the users of the road system.

BMROSS has developed a scoring system using the defined parameters to help prioritize improvement needs as per the relationship shown in Figure 2 and weigh the importance of different parameters similarly to the 1991 version of the MTO manual.

Figure 2: Relationship between Data Collected and Calculated Priority Scores

Within Appendix C-2, is a table showing the priority score calculation factors used to help prioritize the needs, however this section includes an explanation also:

Performance Grade

The Performance Grade is calculated using the platform width of the road surface, maintenance demand and alignment value scores for each road section follows. If the platform width of a road section is adequate for its application based on the traffic volume, a score of 1 was applied. If the width was somewhat narrow, a score of 3 was applied and if the road was significantly narrower than it should be, a score of 5 was applied. For the maintenance demand: if the road section was recorded to be a no winter maintenance road, or it is a newly re-constructed road with minimal maintenance requirements, it was considered low maintenance and a score of 1 was applied. All other road sections are considered average and assigned a score of 2 unless it was a road, which the municipal staff noted, that required extra maintenance. For example, in the spring extra maintenance is required to address soft spots or is shifting due to frost, then it was considered high or excessive, scoring 4 or 5. Other examples: asphalt roads that have cracks developing in the surface prematurely and roads that experience erosion along the surface or shoulder, as a result of flooding, are also considered roads with a higher than average or excessive maintenance needs. For alignment value: if a visual review of both the vertical and horizontal alignments were acceptable, or if the road appeared to be properly signed to identify all the alignment risks, the score was 1. If only one of the alignment components was not acceptable, the score was 3. If both the vertical and horizontal alignment were not acceptable the score was 5.

Probability of Failure

The surface and structural condition ratings as described earlier in the report, and the drainage rating were used for the probability of failure factor. Similarly to above, good, fair and poor drainage condition ratings were assigned a score of 1, 3 or 5. The probability of failure calculation is weighted towards the structural rating, as the score for that component is multiplied by 2. The surface rating score is also used to help predict the year of needs, as explained earlier. Drivers are generally most concerned about the condition of the road surface, but the structure under the road and the adequacy of the road drainage system determines how quickly the condition of the road surface will deteriorate; therefore, they are considered to be as important, or more important, than the condition of the road surface. The road surface score focuses on the condition of the road surface and ride quality.

Consequence of Failure

For this study, the consequence of failure was determined by traffic volume. The consequence of failure is the parameter used to take into account the importance of the road, or how many would be affected if the condition of the road was unacceptable. The traffic volumes on each road section were based on the supplied or assumed traffic volumes on each road section provided by or reviewed by the Municipality. A score of 1 means it has an average annual daily traffic value of less than 50 and a road with greater than a 1000 vehicles per day would have a score of 5.

Figure 2 suggests that combining the probability of failure rating with the performance standard gives a level of service value; and combining the probability of failure and consequence of failure value yields the risk score for each asset. Although these are just relative numbers, Municipalities may choose to define a targeted average level of service or risk value for their road-system. These may be set at different values for different classes of roads. They can also monitor and track these average scores over time for future comparison purposes. The theoretical priority score for each asset is the combined score of the level of service factor and the risk factor. Defining the desired level of service or acceptable levels of risk are beyond the scope of this study so only the priority score has been used.

The theoretical priority score can be used as a guide to help prioritize improvement work on the assets. However, there are other factors that should be taken into account when prioritizing the road improvements. Factors including preventative maintenance activities, scheduling tasks to coincide with integrated assets within the same area, financial and timing constraints and other activities taking place within the locale must be considered by municipal staff. It is impossible to take into account all these other factors in a simplified scoring system. For this reason, the theoretical score of highest priorities established on an individual asset basis should only be used as a guide and the best sequence for improvements should be established by the Municipality. Additional considerations about preventative maintenance will be discussed in Section 7 of this report.

For low traffic volume roads with asphalt surfaces it is recommended that surface reconstruction be delayed until other work is required on streets in the immediate area. Work on urban streets should be coordinated with repairs to nearby or adjoining road sections and with other infrastructure whenever possible to minimize total costs.

4.0 SUMMARY OF ROAD DATA COLLECTED

The road system was assembled on maps, data collected, and condition ratings assigned for each of the road sections. A road section was generally defined as an individual block. In rural areas these would have lengths of approximately 2 km and run between the Lines and Roads. Similarly, urban areas and urban fringe road sections were divided up by blocks or in some cases, sections with similar surface characteristics.

Appendix A-1 is a summary of the complete road inventory, listed by road section number and Appendix A-2 gives the same information sorted by road name. For additional data, such as road widths and roadside environment, the individual appraisal sheets must be referenced. The maps enclosed in Appendix B-1 identify the location, name and inventory number, and surface type for each section.

Table 2 shows a summary of the lengths of different surfaces currently owned by the Municipality. Table 3 summarizes the lengths of different cross-section types.

Table 2: Inventory by Road Surface

Road Surface Type	Length (km)
Gravel	80.96
HCB – 1 lift	13.92
HCB – 2 lifts	93.93
LCB – 1 lift	0.84
LCB – 2 lifts	145.71
Total	335.36

Table 3: Inventory by Road Cross-Section

Roadside Environment	Length (km)
Urban	57.3
Semi-Urban	43.4
Rural	234.7
Total	335.4

Based on the information in Table 2 and the assumed deterioration rates discussed in Section 3, the approximate theoretical number of kilometres, which should be improved each year in order to maintain the road system, is shown in Table 4. These amounts assume that the Municipality has been improving road sections in accordance with Table 4 continuously since the start of the road system. If this is not the case and less work has been completed in past years, or past work is deteriorating faster than projected, more kilometres must be improved in the future in order to put the road improvements back on track.

Table 4: Theoretical Kilometres of Improvements Per Year Required to Maintain Road System

Surface	Assumed Life *	Recommended (km/year)
Gravel	100	0.81
LCB	6	24.45
HCB – 1 lift	15	0.93
HCB – 2 or 3 lifts	30	3.13

* For simplicity the assumed life expectancy used in this table is the maximum life expectancies listed in Table 1.

Table 5 shows the recent road appraisal average condition ratings for road surface and road structure at the time of the field review and splits the weighted averages up based on different road surface types. Figure 3 shows a distribution of the condition ratings for the paved and gravel road surfaces.

When reviewing the road appraisal scores, we noticed that the average ratings have decreased slightly since the previous report. That said, the roads were scored slightly differently this time than they were in 2015; we did not split out the score into two parts with a surface and structural score. The 2015 road appraisal indicated that the average condition rating of the roads at the time of review was 7.9. When splitting them into different road surface types the weighted average ratings were 8.4 for the HCB roads, 8.0 for the LCB roads and 7.3 for the gravel roads.

The HCB road average condition ratings has remained similar, it is slightly down from 2015 at 8.4 to 8.1 (average of the structure and surface score) in 2024. Same with LCB average condition rating from a high in 2015 of 7.9 down to 7.3 (average) in 2024. While an 8.1 for HCB is still a good average rating, this suggests is a relatively decline in the average condition rating of the roads within the last 8 years. Many factors could play a role in influencing the average condition ratings, refer to Section 6.0 for more information.

Table 5: Average Condition Ratings

	Surface Rating	Structural Rating
LCB	7.2	7.5
HCB	7.7	8.5
Average (all surface types)	7.4	7.9

Figure 3: Condition Rating by Road Surface

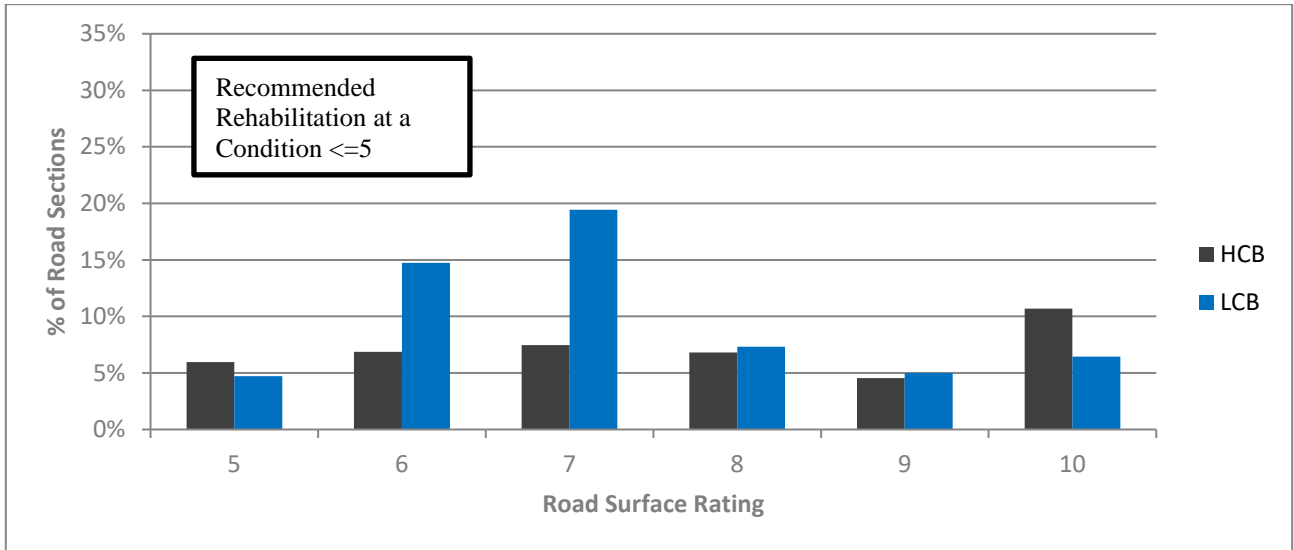

Figure 4: Condition Rating by Road Structural

5.0 NORMAL MAINTENANCE NEEDS (FIXED COSTS)

The Municipality’s first consideration for use of road funds is to address the normal maintenance or fixed cost needs. These items include the normal day-to-day activities to keep the road system operational and include road surface grading and re-surfacing of gravel roads ever second year, roadside maintenance, safety devices and overhead. Funds must be provided for these fixed costs and winter snow removal costs prior to considering expenditures for a construction program. The typical costs per year, are shown in Table 6 based on the 2024 budget values provided by the Municipality. The amounts should be inflated by an appropriate factor for subsequent years.

Table 6: Annual Fixed Cost Budget

Maintenance Item	Cost/year
Roadside Maintenance	\$30,035
Weed Control	\$8,485
Tree Maintenance	\$103,000
Hardtop Maintenance	\$166,600
Loose top Maintenance	\$193,620
Sidewalk Maintenance	\$35,010
Winter Control	\$242,210
Safety Devices	\$103,090
Transfer to Vehicle Reserves	\$30,130
Utilities (Gas, Hydro, etc)	\$382,685
Small Equipment and Vehicles	\$401,025
Administration & Labour	\$1,523,750
Insurance/Training/Miscellaneous	\$395,610
Total	\$3,615,250

When maintenance work on the road sections is not adequately completed the condition of the road will deteriorate quicker and it is generally necessary to perform capital improvements or reconstruction work on the road section sooner.

6.0 GENERAL COMMENTS ABOUT THE ROAD SYSTEM

In general, the rural road system within the Municipality of Strathroy-Caradoc is generally in fair to good condition and well maintained. However, condition ratings suggest several roads need to be rehabilitated over the next few years, as the condition rating of some road sections are approaching a poorer condition.

When comparing the condition rating scores from the 2015 report to the current study, the average condition scores have decreased slightly for the HCB & LCB roads. This may imply that efforts made by the Municipality has not been sufficient enough to keep up to the deterioration rate on HCB & LCB roads. However, since the condition scores are based on a visual assessment and are dependent on the person doing the scoring and the time of year the assessment take place; it is therefore unrealistic to assume that condition rating scores will perfectly align with the deterioration rate of the road. It was also observed that a number of HCB road improvements have been completed in Strathroy over the last nine years, including County Road reconstruction work. Urban road reconstruction work is typically more expensive on a per km basis than rural roads; however, the average condition ratings are calculated on a per km basis. With regards to the LCB roads, we are of the understanding on average 12km of these

roads have been resurfaced annually over the last 3 years but to keep up with the deterioration rate on average of 24km of these road types should be resurfaced per year. We think these factors help to explain why the average condition rating for the HCB and LCB roads on a per km basis has gone down slightly.

During the road appraisals it was noted that roads in Strathroy appear to generally be in fair condition; however, poorer road and drainage conditions were noted in the industrial parks. We observed significant flooding along the park system from Head St west to Victoria St and through the industrial park along the north end of the community. A number of streets with gravel shoulders both in the industrial and residential areas, needed the gravel topped up to improve drainage. Drainage issues were observed in many areas of the community, we understand that the Municipality is working on a Storm Sewer Master Plan. We feel this plan is a very much needed and will be an asset to future planning throughout the community.

While completing the road appraisals in Mount Brydges, drainage issues were also noticed. Overall these roads appear to be fair condition. There are several intersections in Mount Brydges would benefit from some tree trimming. A number of streets with gravel shoulders both in the industrial and residential areas, needed the gravel topped up and regarded to seal the road and redirect water to the boulevard/ditch. There may be some benefit to trying some pavement preservation options here, until storm outlets have been determined.

There rural hard surfaces and hamlets, roads appear to be in fair condition. Most of these roads have LCB surfaces, with a few areas on the LCB roads where water ponds, and frost boils appear to weaken the surface annually. This may be attributed to different soil conditions, insufficient granular road base or swampy areas with inadequate drainage. The drainage within the hamlets appears to be sufficient, the roads appear sufficient for their current use.

It was noted that several rural roads would benefit from some drainage improvements, increase platform/shoulder width and a few LCB roads should be raised to reduce the potential for flooding over the roads. Continued drainage improvement efforts such as topping up shoulder gravel, sub-drains along the edge of the road as required, ditch clean out and brush removal work is encouraged. When the road base is wet it reduces the structural capacity of the road and makes it susceptible to frost action. When the shoulder is not wide enough the road of the road is susceptible to settlement and the edge of the LCB surface can break away. Another commonly observed concern was the encroachment of agricultural lands onto municipal Right-of-Ways. This negatively affects road-base drainage and often resulted in the destruction of road ditches.

Between the paved MTO, County, and municipal roads citizens have good access to nearby paved roads. At this time, we have identify a few road sections that warrant being upgraded from LCB to an HCB surface type due to higher traffic counts. Refer to section 7.3 for more discussion.

6.1 High-Class Bituminous Roads

As noted earlier, the High-Class Bituminous (HCB) roads, commonly referenced to as asphalt roads, have a weighted average score of 7.7 for surface and 8.5 for structure. As stated above in order to sustain this standard of service, current maintenance programs need to continue at least at the current level. This includes continuing the crack-sealing program to preserve the integrity of the road surface and reconstructing the shoulders to support the edge of the road. In urban area, would benefit from full reconstruction with updated storm drainage.

With only one lift of asphalt, once the paved surface becomes unacceptable, the surface has generally been pulverized and resurfaced with a new lift of asphalt. Some municipalities have found that the application of second lift of asphalt or a pavement preservation application, such as a slurry seal, fibre-mat or bonded wearing course, before the base surface has started to lose its shape, increases the life span of the paved surface in a cost-effective way. Often the implementation of the asphalt preservation options does not start until two lifts of asphalt have been applied to the road. The decision to use asphalt or a pavement preservation application is dependent on the traffic loads, the type of defects in the asphalt surface and the structural stability of the road base. Most municipalities experimenting with pavement preservation products have indicated that they are generally pleased with the results; however, it is recognized that a review of existing site conditions should be undertaken to ensure that you implement the appropriate approach for pavement preservation. Different preservation options are better suited for different site conditions.

To maintain road condition of the roads, some other maintenance work is required. The cost to patch the asphalt, crack seal and implement ‘typical’ pavement maintenance methods has been included in the maintenance costs.

6.2 Low-Class Bituminous Roads

As noted earlier, the Low-Class Bituminous (LCB) roads have a weighted average score of 7.2 for surface and 7.5 for structure. This suggests that some of these “tar and chip” type roads are not being maintained in a timely manner. It is recommended that LCB road to be resurfaced every 5-7 years, depending on the traffic count.

Note that, Low-Class Bituminous surfaces can be more accommodating if the road base is not as structurally sound, but the life expectancy of the surface material will be reduced if the surface material has to shift around to accommodate frost action each spring.

6.3 Gravel Roads

The gravels road were excluded from the 2024 road review.

7.0 SPECIFIED MAINTENANCE AND CONSTRUCTION NEEDS

The probable costs of the various types of road improvements have been prepared using “benchmark” costs based on work done in similar rural municipalities. Where applicable, the cost of engineering, supervision and some other assumptions have been included. All these costs are based on 2023 prices and should be adjusted using inflation for work in subsequent years. The benchmark costs used in this study are as shown in Table 7. A more detailed breakdown is presented in Appendix C-1.

Table 7: Benchmark Construction Costs for Year 2024

Rural – 6.7 m Surface Width	
1. Rural Full depth pulverize and pave	\$231/m
2. Rural Full Reconstruction - Base Course Asphalt	\$940/m
3. Rural Full Reconstruction - Gravel Surface	\$758/m
4. Rural Hot Mix Resurfacing (40mm HL-4, incl tack coat)	\$152/m
5. Rural partial depth cold in place and pave (50mm HL-4)	\$270/m

6. Rural Paving (40mm HL-4)	\$135/m
7. Rural Paving (50mm HL-4)	\$178/m
8. Rural Pulverize and Two Lifts Surface Treatment	\$130/m
Semi-Urban – 6.7 m Surface Width	
1. Semi-Urban Full Depth Pulverize and pave	\$260/m
2. Semi-Urban Full Reconstruction - Base Course of Asphalt	\$913/m
3. Semi-Urban Hot Mix Resurfacing	\$178/m
Urban – 8.5 m Surface Width	
1. Urban Full Depth Pulverize and Pave (40mm HL-4)	\$334/m
2. Urban Full depth pulverize, widen and pave	\$710/m
3. Urban Full depth removal and pave - 8.5m	\$645/m
4. Urban Full Reconstruction - Base Course of Asphalt	\$1568/m
5. Urban Partial depth cold planning and resurfacing	\$375/m
6. Edge cut, curb & gutter, top lift of asphalt	\$743/m
7. Urban Paving (40mm HL-4)	\$269/m
Specific Maintenance	
1. Surface Treatment - Single Surface	\$36/m
2. Surface Treatment - Double Surface	\$68/m
3. Gravel resurfacing, 50 mm	\$24/m
4. Ditching Improvements (Full Length)	\$7.00/m
5. Raise Road Grade, 150 mm with gravel	\$76/m
6. Edge Widening 1 m, each side	\$264/m
7. Clearing along sides of ROW, (4 m swath)	\$760/m
8. Install subdrain full length, both sides	\$42/m
9. Pavement Preservation Treatment	\$83/m
10. Crack Sealing	\$12/m
Spot Maintenance	
1. Culvert Crossing up to 750 mm dia., excluding asphalt	\$14,200
2. Ditching Spot Location up to 200 m	\$3,080
3. Raise Grade Line – Gravel 150 mm (<100 m)	\$10,200
4. Asphalt patch up to 60 m, full road width	\$19,900
5. Patch Road with Gravel Surface up to 60 m	\$21,000
6. Paved Surface up to 60 m	\$31,000
7. Shoulder and Slope Repair (100 m)	\$5,900
8. Storm and sewer cress, 1 CB & Subdrain or similar	\$16,300
9. Guiderail (<50 m one side)	\$13,100
10. Subdrain both sides up to 500 m	\$21,100
Miscellaneous	
1. Sidewalk (each side), 1.5 m wide, including restoration	
a) – concrete	\$230/m
b) – gravel	\$47/m
c) – asphalt	\$156/m

d) - unit pavers	\$360/m
2. Storm sewers – incl. CBs and MHs	\$1020/m
3. Minor storm sewer improvements, subdrains, in-line catchbasins, surface restoration	\$356/m

7.1 Asphalt Surfaced vs Gravel Surfaced Roads

A cost comparison was developed to assess the cost difference between providing a paved road with High-Class Bituminous (HCB), a paved road with Low-Class Bituminous (LCB) and a gravel road surface. In an effort to make a fair comparison, the estimated regular maintenance costs were developed using material purchasing costs, provided by the Municipality, but they were increased to include an allowance for municipal staff labour and equipment costs. Table 8 shows that the average cost to maintain an asphalt surfaced road over the long term is about twice as much as for gravel. Appendix C-3 contains the detail calculations for each surface types.

Table 8: Probable Cost per km/yr to Maintain Gravel and Asphalt Roads

Component	Gravel	LCB	HCB
Annual Maintenance	\$6,184	\$954	\$1,344
Annualized Capital Cost	\$0	\$8,576	\$10,931
Total	\$6,184	\$9,530	\$12,276

Note: An asphalt road surface referenced within this section implies a road with a hot mix type of pavement generally referred to as a High-Class Bituminous (HCB). A road with a surface treatment has a bituminous emulsion applied and stone chips compacted in placed on top and is referred to as a Low-Class Bituminous (LCB). The life expectancies are assumed. Gravel prices are based on purchasing maintenance gravel bi-annual, as the Municipal gravel pit has limit years left.

The annualized maintenance cost for the gravel roads includes resurfacing the road with gravel every second year, applying calcium chloride and grading the roads three times throughout the year. If a gravel road had very high traffic volumes, such as 1000 vehicle per day, the road maintenance cost would increase significantly. The numbers presented in the table would generally be applicable for road with traffic volumes less than 400 vehicles per day.

The capital cost for LCB (tar and chip) roads assumes that the road will need to be resurface with an emulsion every 6 years and then pulverized and double coated every 5th time the road is resurfaced. We think doing it every 6 years is a little conservative but, in some municipalities, they have found the LCB does not perform well because large equipment, Amish buggies or other factors deteriorate the LCB surface quicker. While the LCB road surfaces have the ability to knit back together that only works if the road has a decent sub-base and the road surface only distorted a relatively moderate amount.

The capital cost for the asphalt road assumes the road is pulverized, fine graded and repaved every 25 years. Note, this life expectance for a paved road may be considered somewhat optimistic but it is assumed the asphalt surface is finished and beyond the state of rehabilitating after 25 years. To convert the capital cost to an annual cost, the costs were amortized to an equivalent annual cost over the assumed life of the proposed road type with a discount rate of 4%. The life expectancy for the paved road will depend on how well the road base is constructed and the amount of heavy traffic on the road surface. It has been assumed the road receives relatively low traffic volumes, less than 400 vehicles per day. To achieve the life expectancies assumed, an HCB asphalt surface road needs to have a suitable granular base to satisfy the traffic loading requirements and needs to have an effective drainage system for the granular base.

The maintenance costs for the paved surfaces include the application of sand and salt when required during winter months. As this material is typically applied when the snow is being removed only the material costs have been included with the application costs. The maintenance costs for the asphalt roads also include crack sealing, line painting and patching the asphalt roads as well as some costs to perform shoulder maintenance work.

It is generally recommended that roads with traffic volumes above 400 vehicles per day throughout the year would have either a LCB or HCB surface to minimize the maintenance costs and provide a safer road surface for the users.

7.2 Considerations for Geotechnical Investigation

It is a wise decision to consult with a geotechnical firm before you consider specific road upgrades. The types of road upgrades where a municipality would want to retain a geotechnical firm are full reconstruction, upgrading a gravel or LCB surface to asphalt, or widening a road. Geotech work takes between 3-6 months depending on the firm, if the Municipality knows what road they plan to reconstruct, geotech investigations could be completed the year before design and/or tender. As of 2021, it is important to test road soils for contaminants before completing any tender documents to plan for any potential disposal costs, as per the On-Site and Excess Soil Management Regulation 406/19 conditions.

7.3 Road Upgrades to Consider

Within the Municipality there are a few rural LCB roads with relatively high traffic volumes passing over them. This requires additional maintenance needs for these roads, including more frequent applications of LCB lifts. While they still appear to be performing reasonable well, we suspect they will deteriorate quickly and, it has been proposed that the road sections with an LCB surface and AADT greater than 1000 be upgraded to an HCB road type. A list of those road sections is provided in Table 9.

Table 9: Roads to Consider Converting to HCB from LCB Due to Higher Traffic Volumes

Road Name	From	To	Length (m)	Daily Traffic Count (2024)
Glengyle Drive	McEvoy Rd	Amiens Rd	4851	2,200
Amiens Road	Ilderton Rd	Glengyle Dr	950	2,050
Parkhouse Drive	Adelaide Rd	Glendon Dr	2483	2,000
Christina Road	Adelaide Rd	Longwoods Rd	8957	1,150
Falconbridge Drive	Adelaide Rd	Springwell Rd	2121	1,250
Springwell Road	Falconbridge Dr	Glendon Dr	1524	1,500

For now, the construction recommendation within the 10-year plan for most of these roads is still LCB with the exception of Glengyle Dr, as there is already a plan in the works to widen and paved it. Please note, before any surface changes are made on this road a geotechnical investigation should be complete. The road platforms will also have to be widened to improve the shoulders and drainage before the surface type is changed.

The Municipality should recognize that as the road surface types are upgraded from gravel to LBC or HCB to accommodate higher traffic flows, the flows typically increase further because drivers like to drive on the new roads and traffic mapping apps may show these roads and a possible travel route.

8.0 RECOMMENDED IMPROVEMENT PROGRAM AND EXPENDITURE FORECAST

It is generally not possible for Municipalities to complete all the identified road section needs within the theoretical year of need. Typically, the theoretical needs fluctuate from one year to the next and to stay within the Municipality’s budget it is necessary to shift projects from year to year. Also, it is sometimes cost effective and preferred to group adjacent projects together or complete these improvements when address other infrastructure upgrade needs. As funding availability and priorities change, it is expected that it may be necessary to revise the schedule accordingly. If the improvement is significantly delayed beyond the recommended year of need, it may be necessary to change the type of improvement. The proposed year was chosen based on the theoretical year of need, the priority score calculated, attempts to achieve economies of scale by grouping needs by geographic proximity, and to schedule timely improvements to cost effectively extend the life of the roads. The proposed year of need is also adjusted based on consultation with the Municipality.

Tables in Appendix D-1 list the road sections with needs sorted by their proposed year of work and the priority score. Table 10 indicates the expenditure forecast for capital improvements assuming the road work is completed in the proposed year of work is also shown in Appendix E-1 (map). The proposed list of needs resulted in a total of \$68.0 million dollars of costs over the next ten years, of which \$4,186,700 is proposed for 2024; however, please note that the original value of work proposed for 2024 was \$17.0 million until we spread the work out into other years to make it more economical. It is anticipated the Municipality will make adjustments to accommodate other work and satisfy their budget constraints. The proposed schedule assumes that all of the anticipated capital improvement needs will be addressed within the next ten years.

The suggested type of improvement for each road section is listed on the tables provided in the appendix. However, these may be subject to change if other improvements are also required or if this section of road deteriorates at a quicker than expected rate. As more historical information on road sections is accumulated, it should be easier to determine the appropriate type of improvement.

Table 10: Summary of Capital Improvement Costs by Proposed Year of Need

Year	Capital Improvements by Current Surface			Total Cost (\$,000)
	Gravel (km)	LCB (km)	HCB (km)	
2025	0.0	4.7	3.4	\$ 4,186.7
2026	0.0	20.6	3.6	\$ 8,569.5
2027	0.0	18.8	3.2	\$ 5,061.7
2028	0.0	19.5	3.9	\$ 8,388.1
2029	0.0	24.8	8.2	\$ 14,216.0
2030	0.0	22.0	4.5	\$ 8,354.8
2031	0.0	11.0	7.3	\$ 7,578.6
2032	0.0	9.6	4.3	\$ 7,323.8
2033	0.0	7.1	2.8	\$ 3,033.5
2034	0.0	7.5	0.8	\$ 1,254.0
Total	0 km	145.6km	42km	\$ 67,966.7
Average	0 km/yr	14.6 km/yr	4.2km/yr	\$ 6,796.7/yr

Notes:

- 1) Costs excluded HST
- 2) The Municipality typical cost sharing policy for road reconstruction costs allocates budget funds from 40% roads, 20% storm, 20% wastewater and 20% water within settlement areas.

This work does not include upgrading any gravel surfaces to HCB. This work does include the cost of some drainage improvements in urban areas. If the Municipality is unable to accommodate all the costs identified, it may be acceptable to resurface some of these roads with a slurry seal or alternative pavement preservative product and upgrade them at a later time. To delay the improvements possibly to align the work scheduled for road improvements with other infrastructure projects, it is sometimes preferred to do additional road maintenance along that road section until the two projects can be completed at the same time.

The above table suggested that the length of road improvements over the next ten years would be significantly less than the theoretical lengths listed earlier in the report. In Table 4, the theoretical rehabilitation rates calculated based on the assumed life expectancies were 0.8 km/year for gravel, 24.4km/year for LCB and 4.0 km/year for HCB surfaces. However, since the Municipality normally includes work completed or administrated by their own staff in the maintenance budget, we have excluded some tasks that may normally be considered capital improvements from Table 10. These are listed with maintenance work and includes patching HCB roads, crack sealing or raising gravel road. As a result, the maintenance budget is higher than in the past. An explanation of the work included in the maintenance budget instead of the capital budget follows.

The total of \$391,300 has been included in the maintenance needs table presented in Appendix D-2. When this work is spread evenly over the 10-year expenditure forecast it equates to \$39,130 /year. Some of these improvements are beyond the scope of typical maintenance work, however, this work is typically either completed by municipal staff or administered by municipal staff. It is anticipated the municipal staff will group some of these tasks together and schedule the completion of this work as it fits their schedule.

As suggested in the earlier referenced Ministry of Transportation guidelines, capital improvements would generally not be scheduled for roads with traffic volumes less than 50 AADT, even if they were identified as a need. It is assumed that additional maintenance work will be performed on all the gravel and low volume roads, as required, within the maintenance budget or when other work is required in the area.

When preparing budget costs for the improvements, it was necessary to make some assumptions to simplify this process. Improvements as indicated may not uniformly apply along an entire road section as assumed. For example, it is possible that a road recommended for resurfacing will have spot locations that will require rebuilding of the road base and the condition of the road will deteriorate prior to when the improvements are completed. Prior to road improvements being undertaken a more detailed examination of the road section to be improved should be performed to identify if possible deviations from the plan are warranted.

The totals presented in Table 11 do not include annual operational costs such as placing maintenance gravel on gravel roads, snow removal, salt and sand costs, staff labour, equipment or fuel costs; as these are generally paid for in a separate line item within the Municipal's budget.

Table 11: Total Suggested 10 Year Expenditure Forecast for Road Improvements

Category	2025	2026	2027	2028	2029
Specific Maintenance Needs	\$39,130	\$39,130	\$39,130	\$39,130	\$39,130
Road Improvements	\$4,186,700	\$8,569,600	\$5,061,700	\$8,388,100	\$14,216,000
Suggested Annual Budget	\$4,225,830	\$8,608,730	\$5,100,830	\$8,727,230	\$14,255,130

Category	2030	2031	2032	2033	2034
Specific Maintenance Needs	\$39,130	\$39,130	\$39,130	\$39,130	\$39,130
Road Improvements	\$8,354,800	\$7,578,600	\$7,323,800	\$3,033,500	\$1,254,000
Suggested Annual Budget	\$68,393,930	\$7,617,730	\$7,362,930	\$3,072,630	\$1,293,130

Note: - The above table does not include the costs for any bridge repairs, equipment costs or staff labour. Any needed bridge improvements and other infrastructure upgrades should be scheduled in conjunction with the road improvements to minimize the need for duplication of work and reduce costs.

- These maintenance costs are above what the Municipality is already spending per year.
- Unit costs used in Table 8 are based upon relatively small or individual contracts for each road section. Economies of scale are expected to arise when road sections are grouped into a single contract.
- Costs are in 2024 dollars, have not been inflated and are HST exclusive.

9.0 REGULATION UPDATES

The Ontario regulation 239/02 “Minimum Maintenance Standards for Municipal Highways” was updated in May of 2018. The classification of highways table, see Table 12, was updated to include a wider range of AADT values with minor changes to the classification numbers. The majority of road classifications have not changed; however, where the classification has changed the number has been increased by one.

Highway classification values are used in determining the minimum maintenance standards. Maintenance standards include patrolling frequency, weather maintenance (snow and ice removals), roadway maintenance needs (pot holes, cracks, shoulder drop offs), sign and luminaire inspections.

The road classifications were assessed throughout the Municipality and are present on Figure B-2 which is found in Appendix B-2. This assessment was performed based on the traffic volume data provided by the Municipality. A map showing the traffic volume data assumed has also been included in this appendix.

Table 12: Classification of Highways

Column 1 Average Daily Traffic (number of motor vehicles)	Column 2 91 - 100 km/h speed limit	Column 3 81 - 90 km/h speed limit	Column 4 71 - 80 km/h speed limit	Column 5 61 - 70 km/h speed limit	Column 6 51 - 60 km/h speed limit	Column 7 41 - 50 km/h speed limit	Column 8 1 - 40 km/h speed limit
53,000 or more	1	1	1	1	1	1	1
23,000 - 52,999	1	1	1	2	2	2	2
15,000 - 22,999	1	1	2	2	2	3	3
12,000 - 14,999	1	1	2	2	2	3	3
10,000 - 11,999	1	1	2	2	3	3	3
8,000 - 9,999	1	1	2	3	3	3	3
6,000 - 7,999	1	2	2	3	3	4	4
5,000 - 5,999	1	2	2	3	3	4	4
4,000 - 4,999	1	2	3	3	3	4	4
3,000 - 3,999	1	2	3	3	3	4	4
2,000 - 2,999	1	2	3	3	4	5	5
1,000 - 1,999	1	3	3	3	4	5	5
500 - 999	1	3	4	4	4	5	5
200 - 499	1	3	4	4	5	5	6
50 - 199	1	3	4	5	5	6	6
0 - 49	1	3	6	6	6	6	6

Notes: Table from Ontario Regulation 239/02 Minimum Maintenance Standards for Municipal Highways (Updated May 3, 2018)

10.0 UPDATING THE PLAN

As outlined in the M.T.O. Manual, road management is an ongoing process requiring an annual review of the Municipality’s accomplishments, which is a measure of road improvements, and the identification of any new needs not originally determined.

After each year of the study, the Municipality should compare the completed road program to that recommended in this report and make the appropriate adjustments. Changes would result because of a deviation from the original plan, where some work was not done because of other critical work, or where additional work was accomplished. Furthermore, the condition rating forecast may be adjusted for some roads that did not perform as expected. These conditions will be noticed by the manager or work crews during the year, while carrying out their normal work activities.

It is recommended that every fifth year, the total road system should again be reviewed to establish updated condition ratings and prepare a current needs assessment report. It is also recommended that a list of all improvements be maintained by annually updating the road inventory sheets. Data containing updated information will be useful when determining the most appropriate method of road rehabilitation in the future.

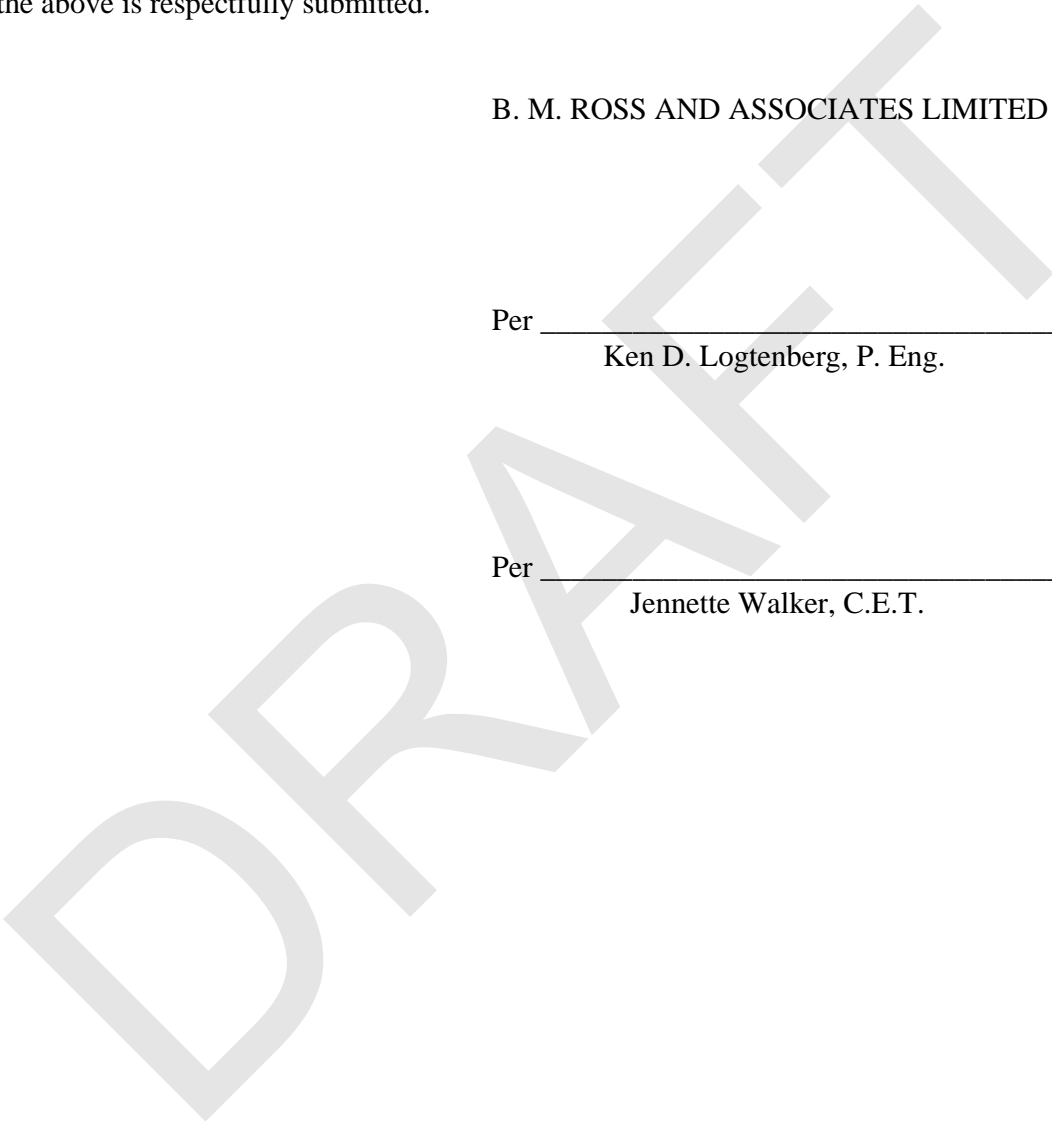

All of the above is respectfully submitted.

APPENDIX C-2

**PRIORITY SCORE CALCULATION
FACTORS FOR ROADS**

DRAFT

Priority Score Calculation Factors for Roads

Consequence of Failure:

Traffic Volume

Traffic Volume	Value
0-49	1
50-199	2
200-499	3
500-999	4
>1000	5

Criticality

Rating	Value
No winter maintenance	-0.5
Fire, public works, commercial, facility, EMO, other	0.5
School, Hospital	1

Performance Grade:

Maintenance Demand

Rating	Value
Low	1
Average	2
High	4
Excessive	5

Alignment

Rating	Value
Both vertical and horizontal acceptable	1
Horizontal or vertical not acceptable	3
Horizontal and vertical not acceptable	5

Platform Width Value based on Traffic Volume

Roadside Environment = Rural or Semi-Urban

Traffic Volume and Platform Width Criteria	Value
0-49 and Platform Width >= 6 m	1
0-49 and Platform Width 5 - 5.9 m	3
0-49 and Platform Width < 5 m	5
50-199 and Platform Width >= 7 m	1
50-199 and Platform Width 6 - 6.9 m	3
50-199 and Platform Width < 6 m	5
200-499 and Platform Width >= 8 m	1
200-499 and Platform Width 7 - 7.9 m	3
200-499 and Platform Width < 7 m	5
500-999 and Platform Width >= 9 m	1
500-999 and Platform Width 8 - 8.9 m	3
500-999 and Platform Width < 8 m	5
>1000 and Platform Width >= 10 m	1
>1000 and Platform Width 9 - 9.9 m	3
>1000 and Platform Width < 9 m	5

Roadside Environment = Urban

Traffic Volume and Platform Width Criteria	Value
all traffic ranges and platform widths	1

Probability of Failure:

Road Surface Rating Value

Rating	Value
>= 9	1
8	2
7	3
6	4
< 6	5

Drainage

Drainage Rating	Value
Good	1
Fair	3
Poor	5

Road Structure Rating Value

Rating	Value
>= 8.5	1
7.5 - 8	2
6.5 - 7	3
5.5 - 6	4
< 5.5	5

Consequence of Failure: Traffic Value + Criticality Value

Probability of Failure: (Surface Condition Value + Drainage Value + (Structure Value * 2) / 4

Performance Grade: (Maintenance Demand + Platform Width Value + Alignment Value) / 3

Risk = Consequence of Failure + Probability of Failure

Level of Service = Performance Grade + Probability of Failure

Priority Score = Risk + Level of Service

APPENDIX C-3

**COST COMPARISON BETWEEN
GRAVEL, LCB AND HCB ROAD TYPES**

DRAFT

Strathroy-Caradoc Gravel vs. Asphalt Road Cost Comparison

Capital Costs for One Lift of Asphalt

Assumptions:

- Roads pulverized and paved in year one and the cost to do that work are spread over the life of the asset.
- **Assumed that the base of the road is already in good condition and suitable to support asphalt surface.**
- Assume that cost is amortized over the life of the road.
- Maintenance costs are spread over all of municipal roads
- Road components as presented below:

Rural Full depth pulverize and pave, 6.7m wide road, 1m shoulder

Pulverize	6700 sq. m	1.8	12,060.00
Granular A	804 t	22	17,688.00
Shoulder Gravel	240 t	24	5,760.00
Fine grade	8700 sq. m	2.5	21,750.00
HL-4 (50mm)	904.5 t	120	108,540.00
Bond/Insur/Traffic/Lump Sum	10.0%		4,973.94
Contingencies	0.0%		0.00
Engineering/Administration	0.0%		0.00
Total Probable Cost per 1000m			<u>170,771.94</u> \$ 171.00/m

Life Expectancy, assumed average	25 years	20 years
Discount Rate for money	4%	4%
Equivalent Annual Expenditure	\$10,931 /km	\$12,566 /km
Total Length of Paved Roads	107.69 km	
Total Length of LCB Roads	146.71 km	
Total Length of Gravel Roads	80.96 km	

Hard Top Maintenance Costs per Year, Paved Roads

Repairs, includes crack sealing, shoulder gravel, patching, line painting....	\$132,350.00
Total Length of Paved Roads	254.4 km
Cost per kilometer of roads	\$520 /km/ year

Road salt and sand application costs, Applied to Paved and LCB roads

Cost to purchase and mix sand and salt for road applications.	\$209,650.00
Total Length of Paved Roads	254.4
Cost per kilometer of roads	\$824 /km/ year

Costs to apply were not included as it has been assumed it would be placed when removing the snow and other miscellaneous costs such as storage, managing has been ignored.

Summary of Paved Road Costs

Maintenance:

Crack sealing, shoulders, patching, etc.	\$520 /km/ year
Road Sand and Salt Costs	\$824 /km/ year

Capital Costs:

Reconstruct surface every 25 years	\$10,931 /km/ year
Total	<u>\$12,276 /km /year</u>

Notes:

Maintenance Costs do not include road side grass cutting, equipment & labour for snow removal equipment costs, fuel, etc.

A relatively low discount rate of 4% has been assumed because Municipality are generally not financing the improvements through a bank.

While an optimistic life expectancy of 25 years has been assumed, an alternative estimate of the capital costs has been calculated assuming a life expectancy of 20 years.

Strathroy-Caradoc Gravel vs. Asphalt Road Cost Comparison

Capital Costs for Single lift of LCB

Assumptions:

- Roads are resurfaced with emulsion every 6 years.
- Assumed that the base of the road is already in good condition and suitable to support emulsion
- Assume that cost is amortized over the life of the road.
- Maintenance costs are spread over all of municipal roads
- **Note: the surface treatment costs were calculated two ways and checked for comparison**
- Road components as presented below:

Surface Treatment - Single surface, 6.7m wide

Single lift surface treatment	6700 sq. m	6.1	40,870.00	
Bond/Insur/Traffic/Lump Sum	10.0%		4,087.00	
Contingencies	0.0%		0.00	
Engineering/Administration	0.0%		0.00	
Total			44,957.00	\$ 42.00/m

Life Expectancy, assumed average	6 years
Discount Rate for money	4%
Equivalent Annual Expenditure	\$8,576 /km
Total Length of Paved Roads	107.69 km
Total Length of LCB Roads	146.71 km

Average Emulsion Costs per Year, LCB Roads

Resurfacing with emulsion using municipal average cost, every 6 yrs	\$0.00
Total Length of LCB Roads	146.71
Cost per kilometer of roads	\$0 /km

Hard Top Maintenance Costs per Year, Paved Roads

Repairs, includes crack sealing, shoulder gravel, patching,	\$132,350.00	
Total Length of Paved Roads	254.4	
Cost per kilometer of roads	\$520 /km	Say \$130/km fo

Road salt and sand application costs, Applied to Paved and LCB roads

Cost to purchase and mix sand and salt for road applications.	\$209,650.00
Total Length of Paved Roads	254.4
Cost per kilometer of roads	\$824 /km

Costs to apply were not included as it has been assumed it would be placed when removing the snow and other miscellaneous costs such as storage, managing has been ignored.

Summary of Paved Road Costs

Maintenance:

Emulsion Application Every 6 year	-	/km/ year
Shoulders, patching, etc.		\$130 /km/ year
Road Sand and Salt Costs		\$824 /km/ year

Capital Costs:

Reconstruct surface every 20 years		\$8,576 /km/ year
Total		\$9,530 /km/ year

Notes:

- Maintenance Costs do not include road side grass cutting and equipment & labour for snow removal
- The more expensive price calculated to apply emulsion has been used in the price comparison.
- If the cost information provided by the Municipality was used the cost would be reduce about \$900/km.
- As the resurfacing work is spreadout of the 6 year period the discount rate has been decreased.

Strathroy-Caradoc Gravel vs. Asphalt Road Cost Comparison

Capital Costs for Gravel Roads

Assumptions:

- Gravel roads will last 100 years, therefore, no capital cost, only maintenance costs.
- Assumed gravel resurface with on average 35mm of A gravel every second year.
- Cost calculated in summary table includes allowance for placement costs

Gravel Resurfacing 30mm, Applied every second year

Operator	4 hrs	68	272.00	
Grader	4 hrs	125	500.00	
Granular A	460.8 t	19	8,755.20	
Calcium	0.9375 sq. m	1500	1,406.25	
Bond/Insur/Traffic/Lump Sum	4.0%		437.34	
Contingencies	0.0%		0.00	
Engineering/Administration	0.0%		0.00	
Total			11,370.79	\$ 12.00/m

Life Expectancy	2 years
Discount Rate for money	0%
Equivalent Annual Expenditure	\$5,690 /km
Total Length of Paved Roads	107.69 km
Total Length of LCB Roads	146.71 km
Total Length of Gravel Roads	80.96 km

Maintenance Costs for Gravel Roads

Annual costs gravel and calcium, excluding placement, purchase costs	\$137,955.00
Total Length of Gravel Roads	80.96
Cost per kilometer of roads	\$1,704 /km

Gravel Labour Costs per Year,

Annual grading, including fuel and equipment cost	\$30,000.00
Allowance for wages and overhead costs	\$10,000.00
Total Length of Gravel Roads	80.96
Cost per kilometer of roads	\$494 /km

Summary of Paved Road Costs

Maintenance:

Bi-annual gravel applicaton	\$5,690 /km/ year
annual grading	\$494 /km/ year

Capital Costs:

Reconstruct surface every 2 years	\$0 /km/ year
Total	\$6,184 /km/ year

Notes:

- Maintenance Costs do not include road side grass cutting and equipment & labour for snow removal
